

Computerized Maintenance Management System (CMMS) Integration to BUILDER

Presented to the **BUILDER™ Summit**

Yousseff Abed, *BUILDER Project Manager*

Kevin Chen, *Statistician/Mathematician*

Alan Deng, *Front-end Developer*

Renelda Lechner-Strand, *FIMS Administrator*

Brody Martinez, *Infrastructure Lifecycle Analyst*

Angel Rodas-Feng, *API Developer*

July 29, 2021

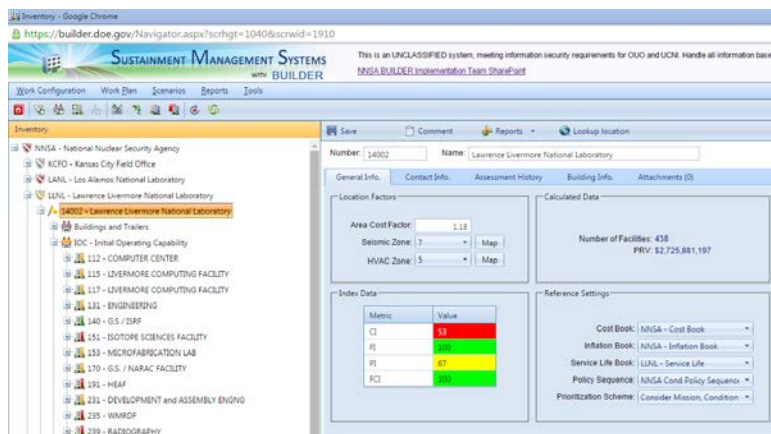

BLUF

- Livermore first achieved CMMS integration in 2018
- NNSA needed an efficient way to implement and maintain site data integration with BUILDER
- We recognized that data sources come and go in our ever-changing IT landscape
- The InSite application and database was built with this basic tenet in mind

As InSite's features continue to evolve, the implementation of data extrapolation continues to be critical as we leverage our soft data relationships and exploit a very powerful CMMS integration application program interface (API)

NNSA BUILDER provides critical data to support agency decision-making

- BUILDER provides:
 - Risk-informed portfolio management based on engineering and life cycle cost data and analysis
 - Funding level scenario analysis and risk projection
 - Correlation of condition to importance across all real property assets
 - Credibility with stakeholders

Livermore's CMMS integration scope

Our InSite application is used to maintain BUILDER inventory and condition from our EAM's MEL and MA-50's CAIS in NNSA's BUILDER instance hosted at ORNL

FIMS asset data is used to Validate BUILDER building data

Definition	Acronym
Enterprise Asset Management System	EAM
Master Equipment List	MEL
Condition Assessment Information System	CAIS
Oak Ridge National Laboratory	ORNL
Facility Management Information Systems	FIMS

Requirement and development constraints for CMMS integration

- 2017 to 2019 Livermore was in the process of migrating from a custom CMMS to the EAM Custom Off The Shelf (COTS) solution
 - NA-52's implementation plan called for CMMS integration in 2018 so a delay was not an option
- Support for a rapidly maturing catalog which requires a significant re-mapping ability
- The solution would have to be flexible enough to support an ever-changing environment
- Support for complex analytics (InSite Demo)

Code design challenge is to produce a flexible, scalable, and configurable solution

InSite provides powerful, specialized processing to represent unique NNSA infrastructure

- Detects retired inventory in EAM and removes them from BUILDER
- Detects new inventory in EAM and creates new inventory in BUILDER
- Detects replaced inventory in EAM and replaces the inventory in BUILDER
- InSite has a bulk re-mapping feature that can move entire systems or just one inventory item and their inspections records to a new catalog item

NNSA infrastructure includes facilities and systems not found in the commercial world

Representation of NSE site by Commercial systems

Configuration Type	2018	Non Standard NNSA Building systems (Additions)	Current Total	Per/Year
BUILDER RPV asset models	76	93	169	60
Building system catalog items	3,819	6,119	10,106	996
Multipliers *	0	179	179	

* Number of multipliers depend on site determinations

InSite Processing capabilities provide for robust data validation and verification

- Detects data discrepancies between EAM facilities, BUILDER buildings and FIMS assets
- Determines assets last inspection date and creates CAIS inspections in BUILDER. It is also able to create calculated model conditions records (synthetics) leveraging a configurable process basically replacing BUILDER's rapid inspection feature with a configurable condition engine
- Keeps processing history since inception (2018)
- Automated synchronization of buildings, inventory and condition between ORNL and LLNL's InSite database
- Keeps BUILDER asset, inventory and condition history(New Feature)

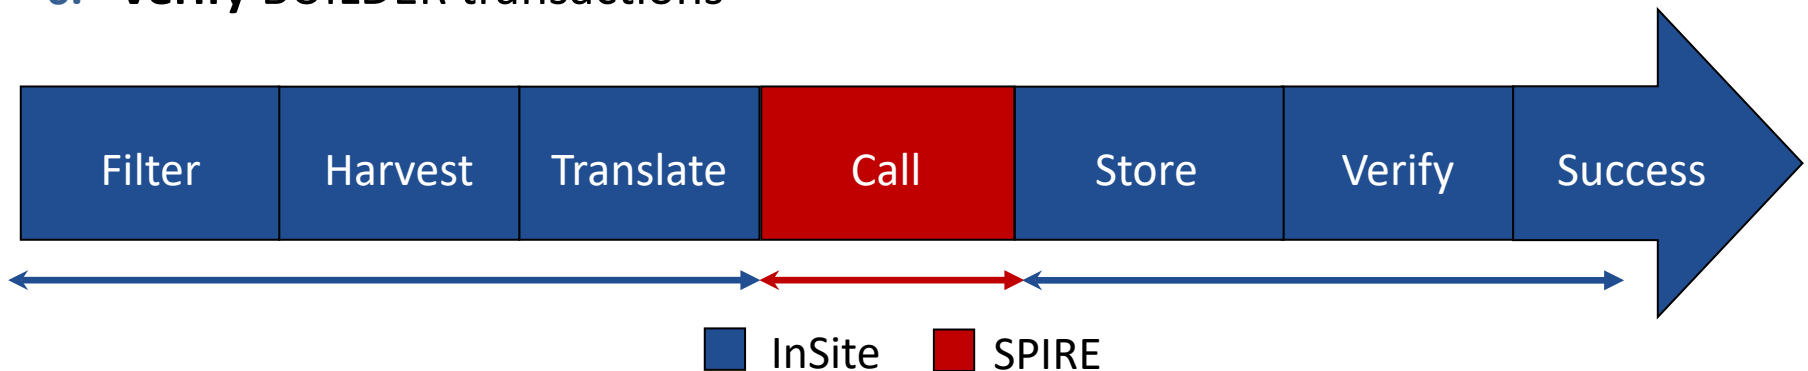

Sophisticated V&V processing capabilities provide confidence in supporting decision making

InSite processing rules enforce rigorous version control

- Transactions are verified post processing
- BUILDER inventory is flat
- Subject matter experts assign catalog entries
- Processing tables are archived weekly with archives going back to 2018
- R&D Modeling experiments are run prior to any major impact processing
- Delete API' s are manual with strict access controls

InSite workflow process is highly integrated to the BUILDER workflow process

1. **Filter** and groups LLNL data for processing
2. **Harvest** and herds LLNL data for processing (Automation)
3. **Translate** LLNL data for SPIRE API
4. **Call** the SPIRE API
5. **Store** SPIRE API return message
6. **Verify** BUILDER transactions
